

Math 72 9.5 - 2nd

Math 62 11.5 - 2nd

Solve logarithmic
Equations

Objectives:

1) Solve log equations

- when argument contains variable

$$\log_b x = a$$

- when base is the variable

$$\log_x c = a$$

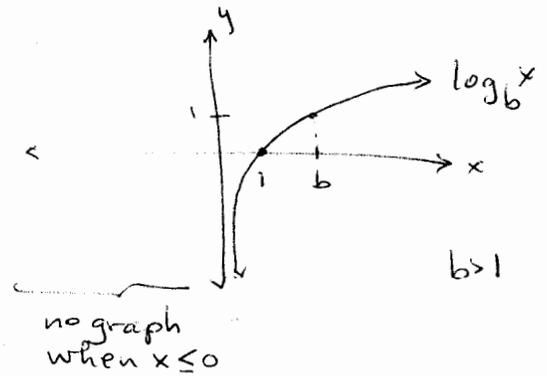

- when log value is the variable

$$\log_b a = x$$

2) Recognize and reject extraneous solutions to log equations

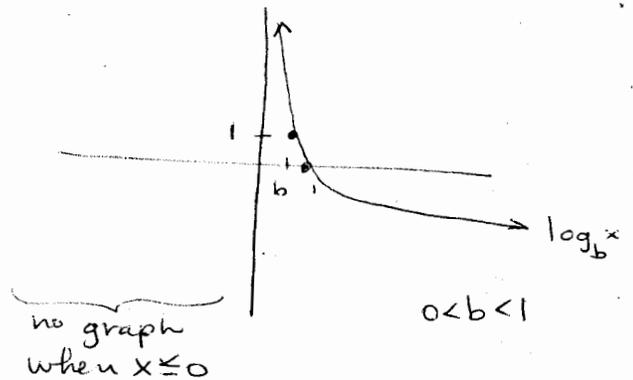

Remember: For any base $b > 0, b \neq 0$

- ① $\log_b(0) = \text{undefined}$
- ② $\log_b(-1) = \text{undefined}$
- ③ $\log_b(\text{any negative \#}) = \text{undefined}$

- ④ The inverse of the log is ...
the exponential of the same base.

- ⑤ The inverse of the exponential is ...
the log of the same base.

When solving log and exp eq'ns:

step 1: Isolate the log or exponential. or use log properties to get one log

step 2: Use the inverse function $\text{exp} \rightarrow \text{log}$ $\text{log} \rightarrow \text{exp}$

step 3: if log eqn, check for extraneous.

Solve.

⑥ $\log_4(x-2) = 3$

step 1: log is already isolated.

step 2: inverse of log is exponential \Rightarrow write exponential eqn.

$$4^3 = x - 2$$

$$64 = x - 2$$

$$\boxed{66 = x}$$

step 3: check for extraneous

$$\log_4(66-2) = \log(\text{positive \#}) \checkmark$$

Solve.

$$\textcircled{7} \log_2 x + \log_2 (x-1) = 1$$

step 1: we have two logs - use log properties to combine

$$\log_2 x(x-1) = 1$$

$$\log_2 (x^2 - x) = 1$$

step 2: We have a log, use its inverse \Rightarrow write exponential equation

$$2^1 = x^2 - x$$

$$2 = x^2 - x$$

quadratic equation - set = 0, solve by factor, QF, CTS

$$x^2 - x - 2 = 0$$

$$(x-2)(x+1) = 0$$

$$x = 2, x = -1$$

step 3: check for extraneous

$$x = 2: \log_2(2) \text{ is defined}$$

$$\log_2(2-1) = \log_2(1) \text{ is defined } \checkmark$$

$$x = -1 \log_2(-1) \text{ is not defined}$$

$$x = -1 \text{ is extraneous.}$$

$$\boxed{x = 2}$$

Math 70

Solve.

$$\textcircled{8} \log_2 x + \log_2 (x-2) = 1$$

step 1: we have two logs - use log properties to combine

$$\log_2 x(x-2) = 1$$

$$\leftarrow \log_b x + \log_b y = \log_b x \cdot y$$

$$\log_2 (x^2 - 2x) = 1$$

step 2: we have a log, use its inverse \Rightarrow write exponential eqn.

$$2^1 = x^2 - 2x$$

$$2 = x^2 - 2x$$

$$0 = x^2 - 2x - 2$$

doesn't factor 😞

$$x = \frac{-(-2) \pm \sqrt{(-2)^2 - 4(1)(-2)}}{2(1)}$$

$$x = \frac{2 \pm \sqrt{4+8}}{2}$$

$$x = \frac{2 \pm \sqrt{12}}{2}$$

$$x = \frac{2 \pm 2\sqrt{3}}{2}$$

$$x = 1 \pm \sqrt{3}$$

$$x^2 - 2x = 2$$

$$\# = \left(\frac{-2}{2}\right) = -1$$

$$\#^2 = (-1)^2 = 1$$

$$x^2 - 2x + 1 = 2 + 1$$

$$(x-1)^2 = 3$$

$$x-1 = \pm\sqrt{3}$$

$$x = 1 \pm \sqrt{3}$$

step 3: check for extraneous in logs of original equation

$$x = 1 + \sqrt{3} \approx 2.7321$$

$$x = 1 - \sqrt{3} \approx -0.7321$$

$$\log_2(1 + \sqrt{3}) = \log_2(+)$$
 ✓

$$\log_2(1 + \sqrt{3} - 1) = \log_2(\sqrt{3}) = \log_2(+)$$
 ✓

$$\log_2(1 - \sqrt{3}) \approx \log_2(-0.7321) = \log_2(-)$$
 ✗

← $x = 1 - \sqrt{3}$ is extraneous

$$\boxed{x = 1 + \sqrt{3}}$$

$$(8) \log(x+2) - \log x = 2$$

Remember $\log(x+2)$ means $\log_{10}(x+2)$.

$$\log\left(\frac{x+2}{x}\right) = 2$$

log property

$$\log_b x - \log_b y = \log_b\left(\frac{x}{y}\right)$$

$$10^2 = \frac{x+2}{x}$$

exponential equation is
inverse of log equation

$$100 = \frac{x+2}{x}$$

$$100x = x+2$$

clear fractions

$$99x = 2$$

$$x = \frac{2}{99}$$

isolate x

$$\log\left(\frac{2}{99} + 2\right) = \log(+)$$
 ✓

check for extraneous

$$\log\left(\frac{2}{99}\right) = \log(+)$$
 ✓

$$\boxed{x = \frac{2}{99}}$$

(9) Approximate solution using GC, nearest hundredth.

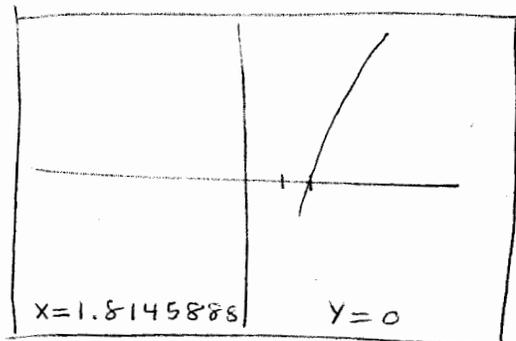

$$\ln(1.3x - 2.1) + 3.5x - 5 = 0$$

$$y_1 = \ln(1.3x - 2.1) + 3.5x - 5$$

since eqn = 0

want $y=0 \rightarrow$ x intercept
 \Rightarrow zero

2nd **TRACE** = CALC
2. zero

\rightarrow until an x-coord appears, with negative y coordinate, **ENTER**

\rightarrow until y-coord positive, **ENTER** **ENTER**

$$x \approx 1.814$$

$$\boxed{x = 1.81}$$

- 2, solns
 (10) Approximate solution, using GC, to nearest hundredth.
 $2 \log(-5.6x + 1.3) = -x - 1$

$$Y_1 = 2 \log(-5.6x + 1.3)$$

$$Y_2 = -x - 1$$

Since equation $\neq 0$
 find intersection.

[2nd] [TRACE] = CALC
 5. Intersect

1st curve? [enter]

2nd curve? [enter]

Guess? move cursor closer to
 one of points of intersection

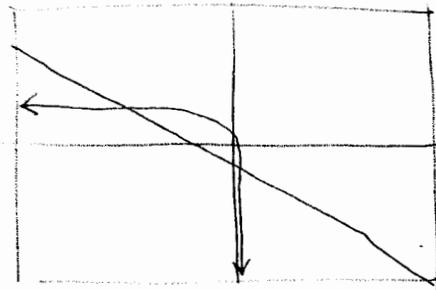

Repeat process to get
 2nd solution.

$$x \approx -3.681549$$

$$x \approx .18658985$$

$$\boxed{\begin{array}{l} x = -3.68 \\ x = .19 \end{array}}$$

remember [-] for x
 but [=] for 1

↑
 log equation
 has vertical asymptote

These graphs cross twice,
 so there are two solutions.

Note: we cannot solve # 10 or # 9 analytically
 because the variable appears both inside
 the log and out.

Extras

Solve

$$(11) \quad 1 + \log_2 \sqrt{x} = 5$$

$$\log_2 \sqrt{x} = 5 - 1$$

$$\log_2 \sqrt{x} = 4$$

$$2^4 = \sqrt{x}$$

$$16 = \sqrt{x}$$

$$(16)^2 = (\sqrt{x})^2$$

$$\boxed{x = 256}$$

$$\text{check: } 1 + \log_2 \sqrt{256}$$

$$= 1 + \log_2 16$$

$$= 1 + \frac{\log(16)}{\log(2)}$$

$$= 5 \checkmark$$

$$(12) \quad \ln(4x-5) - \ln(x-2) = \ln(2x+1)$$

$$\ln\left(\frac{4x-5}{x-2}\right) = \ln(2x+1)$$

$$\frac{4x-5}{x-2} = 2x+1$$

← exp on e must be the same
on LHS as on RHS

$$4x-5 = (2x+1)(x-2) \leftarrow \text{clear frac}$$

$$4x-5 = 2x^2 - 4x + x - 2$$

$$4x-5 = 2x^2 - 3x - 2$$

$$0 = 2x^2 - 7x + 3$$

$$0 = (2x-1)(x-3)$$

$$x = \frac{1}{2} \quad x = 3$$

$\ln\left(\frac{1}{2} - 2\right) = \ln(-)$ so $x = \frac{1}{2}$ is extraneous

$$\ln(4 \cdot 3 - 5) = \ln 7 = \ln(+)$$

$$\ln(3 - 2) = \ln 1 = \ln(+)$$

$$\ln(2 \cdot 3 + 1) = \ln 7 = \ln(+)$$

So $\boxed{x=3}$ is valid

$$(13) \log(1-2x) = \log 5$$

$$1-2x = 5$$

$$-2x = 4$$

$$\boxed{x = -2}$$

check: $\log(1-2 \cdot (-2)) = \log(1+4) = \log 5 \checkmark$

$$(14) \frac{1}{2} \ln(3x-1) = \ln 5$$

$$\ln \sqrt{3x-1} = \ln 5$$

$$\sqrt{3x-1} = 5$$

$$3x-1 = 25$$

square both sides

$$3x = 26$$

$$\boxed{x = \frac{26}{3}}$$

check:

$$\ln\left(3 \cdot \frac{26}{3} - 1\right) = \ln(26-1) = \ln 25 \checkmark$$

$$(15) \log(275x^2) = 8$$

write exponential form, base 10

$$10^8 = 275x^2$$

10^8 is enormous!
Don't calculate it

divide both sides by 275 to isolate x^2

$$\frac{10^8}{275} = x^2$$

square root both sides

$$\boxed{x = \pm \sqrt{\frac{10^8}{275}}} = \pm \sqrt{\frac{7000000}{11}}$$

approx value. (if instructions ask to round...)

$$x \approx \pm 603.0227$$

Is $-\sqrt{\frac{10^8}{275}}$ extraneous? no. In the original, x is squared.

$$(16) \log(492x) = 5.728$$

Write exponential form, base 10

$$10^{5.728} = 492x$$

divide by 492 to isolate x

$$\boxed{\frac{10^{5.728}}{492} = x} \text{ exact}$$

If instructions say to round...

$$x \approx 1086.5129$$

$$(17) \frac{3.01}{\ln x} = \frac{28}{4.31}$$

cross-multiply to clear fractions

$$(3.01)(4.31) = 28 \ln x$$

$$12.9731 = 28 \ln x$$

divide by 28 to isolate the logarithm

$$\frac{12.9731}{28} = \ln x$$

rewrite with log on LHS

$$\ln x = \frac{12.9731}{28} = .463325$$

Write in exponential form, base e

$$\boxed{e^{.463325} = x} \text{ exact}$$

If instructions say to round...

$$x \approx 1.5893$$

$$(18) \quad \log 692 + \log x = \log 3450$$

just a number! subtract from both sides

$$\log x = \log 3450 - \log 692$$

use log property $\log_b a - \log_b c = \log_b \frac{a}{c}$

$$\log x = \log \left(\frac{3450}{692} \right)$$

If two logs have equal bases and are equal to each other then the arguments must be equal!

$$x = \frac{3450}{692}$$

$$\boxed{x = \frac{1725}{346}}$$

Method 2: Move all logs to LHS, combine using log prop

$$\log 692 + \log x - \log 3540 = 0$$

$$\log \left(\frac{692x}{3540} \right) = 0$$

Write in exponential form, base 10

$$10^0 = \frac{692x}{3540}$$

simplify exponent

$$1 = \frac{692x}{3540}$$

isolate x

$$3540 = 692x$$

$$\boxed{\frac{3540}{692} = x}$$
